6.1 A

The accompanying data on flexural strength (MPa) for concrete beams of a certain type was introduced in Example 1.2.

5.9	7.2	7.3	6.3	8.1	6.8	7.0
7.6	6.8	6.5	7.0	6.3	7.9	9.0
8.2	8.7	7.8	9.7	7.4	7.7	9.7
7.8	7.7	11.6	11.3	11.8	10.7	

a. Calculate a point estimate of the mean value of strength for the conceptual population of all beams manufactured in this fashion, and state which estimator you used. [*Hint*: $\Sigma x_i = 219.8$.]

b. Calculate a point estimate of the strength value that separates the weakest 50% of all such beams from the strongest 50%, and state which estimator you used.

c. Calculate and interpret a point estimate of the population standard deviation σ. Which estimator did you use? [*Hint*: $\Sigma x_i^2 = 1860.94$.]

d. Calculate a point estimate of the proportion of all such beams whose flexural strength exceeds 10 MPa. [*Hint*: Think of an observation as a "success" if it exceeds 10.]

e. Calculate a point estimate of the population coefficient of variation σ/μ, and state which estimator you used.

a. Use rules of expected value to show that $\bar{X} - \bar{Y}$ is an unbiased estimator of $\mu_1 - \mu_2$. Calculate the estimate for the given data.

b. Use rules of variance from Chapter 5 to obtain an expression for the variance and standard deviation (standard error) of the estimator in part (a), and then compute the estimated standard error.

c. Calculate a point estimate of the ratio σ_1/σ_2 of the two

a

mean value

$$\hat{m} = \bar{x} = \frac{\Sigma x_i}{n} = \frac{219.8}{27}$$

$$= 8.1407$$

b use the sample value

$$\tilde{x} = 7.7$$

c

$$\sigma = \sqrt{s^2} = \sqrt{\frac{\Sigma x_i^2 - \frac{[\Sigma x_i]^2}{n}}{n-1}}$$

$$= 1.660$$

d

$$p = \frac{n'}{n} = \frac{4}{27} \doteq 0.1481$$

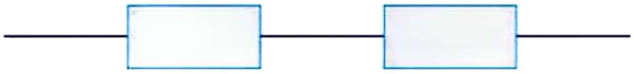
e

$$\frac{\sigma}{\mu} = \frac{s}{\bar{x}} = \frac{1.660}{8.1407} \doteq 0.2308$$

8. In a random sample of 80 components of a certain type, 12 are found to be defective.

a. Give a point estimate of the proportion of all such components that are *not* defective.

b. A system is to be constructed by randomly selecting two of these components and connecting them in series, as shown here.



The series connection implies that the system will function if and only if neither component is defective (i.e., both components work properly). Estimate the proportion of all such systems that work properly. [*Hint*: If p denotes the probability that a component works properly, how can P(system works) be expressed in terms of p?]

8

a. $p = 1 - \frac{n'}{n} = 1 - \frac{12}{80}$

$$= 0.85$$

b

$$P = p^2 = \left(\frac{68}{80}\right)^2 \doteq 0.7225$$

9. Each of 150 newly manufactured items is examined and the number of scratches per item is recorded (the items are supposed to be free of scratches), yielding the following data:

Number of scratches per item	0	1	2	3	4	5	6	7
Observed frequency	18	37	42	30	13	7	2	1

Let X = the number of scratches on a randomly chosen item, and assume that X has a Poisson distribution with parameter μ.

a. Fi… estimator of μ and compute the estimate for … [*Hint*: $E(\bar{X})$) $= \mu$ for X Poisson, so $E(\bar{X}) = ?$]

b. What is the standard deviation (standard error) of your estimator? Compute the estimated standard error. [*Hint*: $\sigma_{\bar{X}}^2 = \mu$ for X Poisson.]

a $E(\bar{X}) = m = E(X)$

$\bar{X}$ is an unbiased estimator

$$\bar{x} = \frac{\sum x_i}{n} = \frac{317}{150} = 2.11$$

b.

$$S_{\bar{X}} = \frac{S}{\sqrt{n}} = \frac{\sqrt{\bar{x}}}{\sqrt{n}} = \frac{\sqrt{2.11}}{\sqrt{150}} = 0.119$$

3. Consider a random sample $X_1, \ldots, X_n$ from the pdf

$$f(x; \theta) = .5(1 + \theta x) \qquad -1 \le x \le 1$$

where $-1 \le \theta \le 1$ (this distribution arises in particle physics). Show that $\hat{\theta} = 3\bar{X}$ is an unbiased estimator of θ. [*Hint*: First determine $\mu = E(X) = E(\bar{X})$.]

$$E(X) = \int_{-1}^{1} x \cdot f(x;\theta)\,dx$$

$$= \int_{-1}^{1} x \cdot \frac{1}{2}(1+\theta x)\,dx$$

$$= \frac{x^2}{4} + \frac{\theta x^3}{6}\Big|_{-1}^{1} = \frac{1}{3}\theta$$

$$E(X) = \frac{1}{3}\theta$$

$E(\bar{X}) = \frac{1}{3}\theta$ $\quad \hat{\theta} = 3\bar{X}$ $\quad E(3\bar{X}) = 3E(\bar{X})$

$= \theta$

section 6.2.

20. A diagnostic test for a certain disease is applied to n individuals known to not have the disease. Let X = the number among the n test results that are positive (indicating presence of the disease, so X is the number of false positives) and p = the probability that a disease-free individual's test result is positive (i.e., p is the true proportion of test results from disease-free individuals that are positive). Assume that only X is available rather than the actual sequence of test results. 23

a. Derive the maximum likelihood estimator of p. If $n = 20$ and $x = 3$, what is the estimate?

b. Is the estimator of part (a) unbiased?

c. If $n = 20$ and $x = 3$, what is the mle of the probability $(1 - p)^5$ that none of the next five tests done on disease-free individuals are positive?

a $\quad \hat{p} = \frac{x}{p} = \frac{3}{20} = 0.15$

b. $E(\hat{p}) = E(\frac{X}{n}) = \frac{1}{n}E(X)$

$= \frac{1}{n}E(np)$

$\hat{p}$ is an unbaised estimator

c $\quad (1 - 0.15)^5 = 0.4437$

21. Let X have a Weibull distribution with parameters α and β, so

$$E(X) = \beta \cdot \Gamma(1 + 1/\alpha)$$
$$V(X) = \beta^2\{\Gamma(1 + 2/\alpha) - [\Gamma(1 + 1/\alpha)]^2\}$$

a. Based on a random sample $X_1, \ldots, X_n$, write equations for the method of moments estimators of β and α. Show that, once the estimate of α has been obtained, the estimate of β can be found from a table of the gamma function and that the estimate of α is the solution to a complicated equation involving the gamma function.

b. If $n = 20$, $\bar{x} = 28.0$, and $\sum x_i^2 = 16{,}500$, compute the estimates. [*Hint*: $[\Gamma(1.2)]^2/\Gamma(1.4) = .95$.]

2)

$E(X) = \beta \cdot \Gamma(1+\frac{1}{\alpha})$

$E(X^2) = V(X) + [E(X)]^2$

$= \beta^2\{\Gamma(1+2/\alpha) - [\Gamma(1+1/\alpha)]^2\} +$

$\beta^2[\Gamma(1+\frac{1}{\alpha})]^2$

$= \beta^2\,\Gamma(1+2/\alpha)$

$\bar{X} = \hat{\beta} \cdot \Gamma(1+\frac{1}{\hat{\alpha}})$

$\hat{\beta} = \dfrac{\bar{X}}{\Gamma(1+\frac{1}{\hat{\alpha}})}$

so if $\hat{\alpha}$ has been determined

$\Gamma(1+\frac{1}{\hat{\alpha}})$ is evaluated $\hat{\beta}$ can compute

b $\frac{1}{20}\left(\frac{16500}{28.0}\right) = 1.05 = \dfrac{\Gamma(1+\frac{2}{\hat{\alpha}})}{\Gamma(1+\frac{1}{\hat{\alpha}})}$

$\hat{\alpha} = 5$ $\quad \hat{\beta} = \dfrac{\bar{X}}{\Gamma(1.2)} = \dfrac{28.0}{\Gamma(1.2)}$

29. Consider a random sample $X_1, X_2, \ldots, X_n$ from the shifted exponential pdf

$$f(x; \lambda, \theta) = \begin{cases} \lambda e^{-\lambda(x-\theta)} & x \geq \theta \\ 0 & \text{otherwise} \end{cases}$$

Taking $\theta = 0$ gives the pdf of the exponential distribution considered previously (with positive density to the right of zero). An example of the shifted exponential distribution appeared in Example 4.5, in which the variable of interest was time headway in traffic flow and $\theta = .5$ was the minimum possible time headway.

a. Obtain the maximum likelihood estimators of θ and λ.

b. If $n = 10$ time headway observations are made, resulting in the values 3.11, .64, 2.55, 2.20, 5.44, 3.42, 10.39, 8.93, 17.82, and 1.30, calculate the estimates of θ and λ.

a $f(x_1, \ldots x_n, \lambda, \theta) = \begin{cases} \lambda^n e^{-\lambda\sum(x_i-\theta)} \\ 0 \end{cases}$

$x_1 \cdots x_n \geq \theta$ if $\min(x_i) \geq \theta$

$-\lambda\sum(x_i-\theta) = -\lambda\sum x_i + n\lambda\theta$

$\hat{\lambda} = \dfrac{n}{\sum x_i - n\hat{\theta}}$ $\quad \hat{\theta} = \min(x_i)$

b

$\hat{\theta} = \min(x_i) = .64$

$\hat{\lambda} = \dfrac{n}{\sum x_i - n\cdot\hat{\theta}} = .202$

32. a. Let $X_1, \ldots, X_n$ be a random sample from a uniform distribution on $[0, \theta]$. Then the mle of θ is $\hat{\theta} = Y = \max(X_i)$. Use the fact that $Y \le y$ iff each $X_i \le y$ to derive the cdf of Y. Then show that the pdf of $Y = \max(X_i)$ is

$$f_Y(y) = \begin{cases} \dfrac{ny^{n-1}}{\theta^n} & 0 \le y \le \theta \\ 0 & \text{otherwise} \end{cases}$$

b. Use the result of part (a) to show that the mle is biased but that $(n + 1)\max(X_i)/n$ is unbiased.

$$F_Y(y) = P(Y \le y)$$
$$= P(X_1 \le y, X_2 \le y, \ldots, X_n \le y)$$
$$= P(X_1 \le y) \cdots P(X_n \le y)$$
$$= \left(\frac{y}{q}\right)^n$$
$$f_Y(y) = \frac{n \cdot y^{n-1}}{q^n}$$

b $$E(Y) = \int_0^q y \cdot \frac{n \cdot y^{n-1}}{n}\, dy$$
$$= \frac{n}{n+1} q$$

$\hat{q} = Y$ is not unbiased.

$E\left[\frac{n+1}{n} Y\right]$ is biased
