## Chapter 3 Selections

### Objectives

- To declare boolean type and write Boolean expressions using comparison operators
  - -To program AdditionQuiz using Boolean expressions
- To implement selection control using one-way if statements
  - -To program the <u>GuessBirthday</u> game using one-way <u>if</u> statements.
  - -To implement selection control using two-way if statements).
  - -To implement selection control using nested <u>if</u> statements
  - -To avoid common errors in <u>if</u> statements
  - -To program using selection statements for a variety of examples (BMI, ComputeTax, SubtractionQuiz)
  - -To generate random numbers using the Math.random() method
- ▼ To combine conditions using logical operators (<u>&&</u>, <u>|</u>, and <u>|</u>)
  - -To program using selection statements with combined conditions (<u>LeapYear</u>, Lottery).
- To implement selection control using switch statements
  - -To write expressions using the conditional operator
- To format output using the <u>System.out.printf</u> method and to format strings using the <u>String.format</u> method
  - -To examine the rules governing operator precedence and associativity
- (GUI) To get user confirmation using confirmation

### The boolean Type and Operators

Compare two values: such as whether i is greater than j. Java provides six comparison operators (also known as relational operators)

The <u>result</u> of the comparison is a Boolean value: true or false.

boolean b = (1 > 2);

## Comparison Operators

Operator Name

< less than

<= less than or equal to

> greater than

>= greater than or equal to

== equal to

! = not equal to

•Comparing characters is the same as comparing their Unicodes.
•For example, 'a' is larger than 'A'

### ASCII Character Set

| TAB | LE B.2 | ASCII C | haracte | r Set in | the He | xadecin | nal Ind | ex  |     |    |     |     |    |    |    |     |
|-----|--------|---------|---------|----------|--------|---------|---------|-----|-----|----|-----|-----|----|----|----|-----|
|     | 0      | 1       | 2       | 3        | 4      | 5       | 6       | 7   | 8   | 9  | A   | В   | C  | D  | E  | F   |
| 0   | nul    | soh     | stx     | etx      | eot    | enq     | ack     | bel | bs  | ht | nl  | vt  | ff | Cľ | SO | si  |
| 1   | dle    | dcl     | dc2     | dc3      | dc4    | nak     | syn     | etb | can | em | sub | esc | fs | gs | ſS | us  |
| 2   | sp     | !       | CC      | #        | \$     | %       | &       | ,   | (   | )  | *   | +   | ,  | -  | ı  | 1   |
| 3   | 0      | 1       | 2       | 3        | 4      | 5       | 6       | 7   | 8   | 9  | 1   | j   | <  | =  | >  | ?   |
| 4   | (a)    | A       | В       | С        | D      | E       | F       | G   | Н   | I  | J   | K   | L  | M  | N  | 0   |
| 5   | P      | Q       | R       | S        | T      | U       | V       | W   | X   | Y  | Z   | [   | \  | ]  | ٨  | -   |
| 6   | ſ      | a       | Ь       | С        | d      | e       | f       | g   | h   | i  | j   | k   | l  | m  | n  | 0   |
| 7   | P      | q       | ľ       | S        | t      | u       | V       | W   | X   | у  | Z   | {   |    | }  | -  | del |

### Problem: AdditionQuiz

#### Let a first grader practice additions.

- •The program randomly generates two single-digit integers <u>number1</u> and <u>number2</u> and displays a question such as "What is 7 + 9?" to the student. After the student types the answer, the program displays a message to indicate whether the answer is true or false.
  - •There are several ways to generate random numbers. For now, generate the first integer: System.currentTimeMillis() % 10 and the second: System.currentTimeMillis() \* 7 % 10.

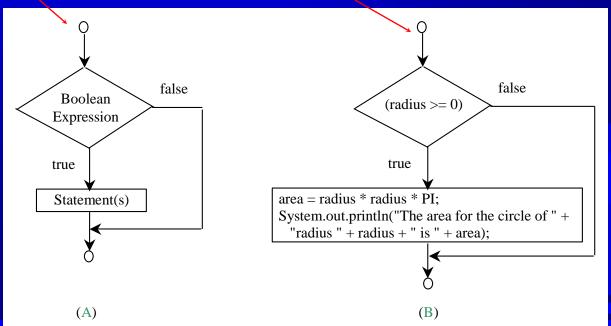

#### LISTING 3.1 AdditionQuiz.java

```
1 import java.util.Scanner;
   public class AdditionQuiz {
     public static void main(String[] args) {
       int number1 = (int)(System.currentTimeMillis() % 10);
                                                                               generate number 1
       int number2 = (int)(System.currentTimeMillis() * 7 % 10);
                                                                               generate number2
 6
       // Create a Scanner
       Scanner input = new Scanner(System.in);
10
       System.out.print(
11
                                                                               show question
         "What is " + number1 + " + " + number2 + "? ");
12
13
       int answer = input.nextInt();
14
15
16
       System.out.println(
                                                                               display result
17
         number1 + " + " + number2 + " = " + answer + " is " +
         (number1 + number2 == answer));
18
19
20 }
```

### One-way if Statements

```
if (boolean-expression) {
  statement(s);
```

```
if (radius >= 0) {
  area = radius * radius * PI;
  System.out.println("The area"
  + " for the circle of radius "
  + radius + " is " + area);
}
```

### Note

```
if i > 0 {
    System.out.println("i is positive");
}

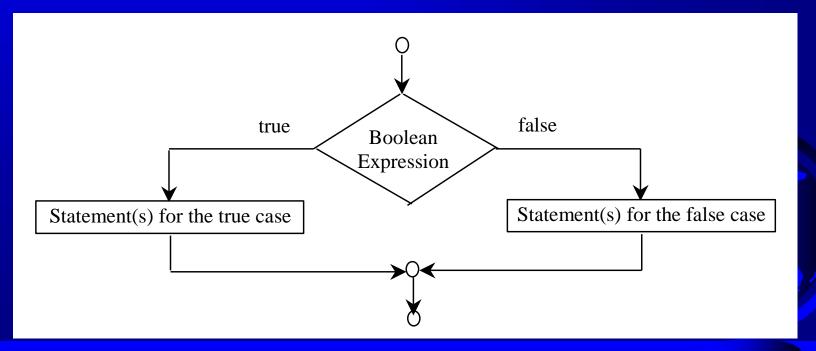

(a) Wrong

if (i > 0) {
    System.out.println("i is positive");
}

(b) Correct
```

### The Two-way if Statement

```
if (boolean-expression) {
   statement(s)-for-the-true-case;
}
else {
   statement(s)-for-the-false-case;
}
```

### Multiple Alternative if Statements

```
if (score \geq 90.0)
  grade = 'A';
else
  if (score \geq 80.0)
    grade = 'B';
  else
    if (score \geq 70.0)
      grade = 'C';
    else
      if (score \geq 60.0)
        qrade = 'D';
      else
        grade = 'F';
```

Equivalent

```
if (score >= 90.0)
  grade = 'A';
else if (score >= 80.0)
  grade = 'B';
else if (score >= 70.0)
  grade = 'C';
else if (score >= 60.0)
  grade = 'D';
else
  grade = 'F';
```

#### Trace if-else statement

#### Suppose score is 70.0

```
if (score >= 90.0)
 grade = 'A';
else if (score \geq 80.0)
 grade = 'B';
else if (score \geq 70.0)
 grade = 'C';
else if (score \geq 60.0)
 grade = 'D';
else
 grade = 'F';
```

Exit the if statement grade=?

### Note

The <u>else</u> clause matches the most recent <u>if</u> clause in the same block.

```
int i = 1;
int j = 2;
int k = 3;

if (i > j)
   if (i > k)
       System.out.println("A");
else
       System.out.println("B");
```

Equivalent

```
int i = 1;
int j = 2;
int k = 3;

if (i > j)
   if (i > k)
        System.out.println("A");
   else
        System.out.println("B");
```

(a)

- •Nothing is printed.
- •To force the <u>else</u> clause to match the first <u>if</u> clause, you must add a pair of braces.

### Note, cont.

```
int i = 1;
int j = 2;
int k = 3;
if (i > j) {
  if (i > k)
    System.out.println("A");
else
  System.out.println("B");
```

#### This statement prints?

#### Common Errors

Adding a semicolon at the end of an if clause

- This mistake is hard to find, because it is not a compilation error or a runtime error, it is a logic error.
  - This error often occurs when you use the next-line block style.

### TIP

```
if (number % 2 == 0)
  even = true;
else
  even = false;
(a)
```

```
Equivalent
```

```
boolean even
= number % 2 == 0;
```

(b)

### CAUTION

```
if (even == true)
   System.out.println(
   "It is even.");
   (a)
```

```
Equivalent
```

```
if (even)
System.out.println(
    "It is even.");
```

(b)

#### Problem: SubstractionQuiz

Teach a first grade child how to <u>learn subtractions</u>. The program randomly generates two single-digit integers <u>number1</u> and <u>number2</u> and <u>displays a question such as "What is 9 - 2?"</u>. After the student types the answer, the program indicate whether the answer is correct.

- To generate random numbers:
  - use the random() method in the Math class, returns a random double value d such that  $0.0 \le d < 1.0$
  - (int) (Math.random()\*10) : a random integer between 0 and 9
- ☞ If number1 < number2, swap number1 with number2.

```
What is 6 - 6? 0 PEnter
You are correct!

What is 9 - 2? 5 PEnter
Your answer is wrong
9 - 2 should be 7
```

#### **LISTING 3.4** SubtractionQuiz.java

```
1 import java.util.Scanner;
 2
 3 public class SubtractionQuiz {
     public static void main(String[] args) {
       // 1. Generate two random single-digit integers
       int number1 = (int)(Math.random() * 10);
 6
                                                                              random numbers
 7
       int number2 = (int)(Math.random() * 10);
 8
9
       // 2. If number1 < number2, swap number1 with number2
       if (number1 < number2) {</pre>
10
         int temp = number1;
11
12
         number1 = number2;
13
         number2 = temp;
14
15
       // 3. Prompt the student to answer "What is number1 - number2?"
16
       System.out.print
17
18
         ("What is " + number1 + " - " + number2 + "? ");
19
       Scanner input = new Scanner(System.in);
       int answer = input.nextInt();
20
                                                                              get answer
21
22
      ## 4. Grade the answer and display the result
       if (number1 - number2 == answer)
23
                                                                              check the answer
24
         System.out.println("You are correct!");
25
       else
         System.out.println("Your answer is wrong\n" + number1 + " - "
26
           + number2 + " should be " + (number1 - number2));
27
28
29 }
```

## Logical Operators

#### Operator Name

! not

& & and

or

exclusive or

## Truth Table for Operator ^

| p1    | p2    | p1 ^ p2 | Example (assume age = 24, gender = 'F')                    |
|-------|-------|---------|--|
| false | false | false   | $(age > 34) \land (gender == 'F')$ is true, because $(age$ |
| false | true  | true    | > 34) is false but (gender == 'F') is true.                |
| true  | false | true    | (age > 34)    (gender == 'M') is false, because (age       |
| true  | true  | false   | $\geq$ 34) and (gender == 'M') are both false.             |

### Examples

Here is a program that checks whether a number is divisible by  $\underline{2}$  and  $\underline{3}$ , whether a number is divisible by  $\underline{2}$  or  $\underline{3}$ , and whether a number is divisible by  $\underline{2}$  or  $\underline{3}$  but not both:

```
Enter an integer: 18 JEnter
Is 18
divisible by 2 and 3? true
divisible by 2 or 3? true
divisible by 2 or 3, but not both? false
```

#### **LISTING 3.7** TestBooleanOperators.java

```
1 import java.util.Scanner;
                                                                                import class
   public class TestBooleanOperators {
     public static void main(String[] args) {
       // Create a Scanner
 6
       Scanner input = new Scanner(System.in);
8
       // Receive an input
       System.out.print("Enter an integer: ");
       int number = input.nextInt();
10
                                                                                input
11
12
       System.out.println("Is " + number +
         "\n\tdivisible by 2 and 3?" +
13
14
         (number \% 2 == 0 \&\& number \% 3 == 0)
                                                                                and
15
         + "\n\tdivisible by 2 or 3?" +
         (number \% 2 == 0 | | | number \% 3 == 0 ) +
16
                                                                                or
         "\n\tdivisible by 2 or 3, but not both? "
17
         + (number % 2 == 0 \land number % 3 == 0 ));
18
                                                                                exclusive or
19
20 }
```

## Problem: Determining Leap Year?

This program first prompts the user to enter a year as an int value and checks if it is a leap year.

A year is a leap year if it is divisible by 4 but not by 100, or it is divisible by 400.

• the boolean expression?

## Problem: Determining Leap Year?

This program first prompts the user to enter a year as an int value and checks if it is a leap year.

A year is a leap year if it is divisible by 4 but not by 100, or it is divisible by 400.

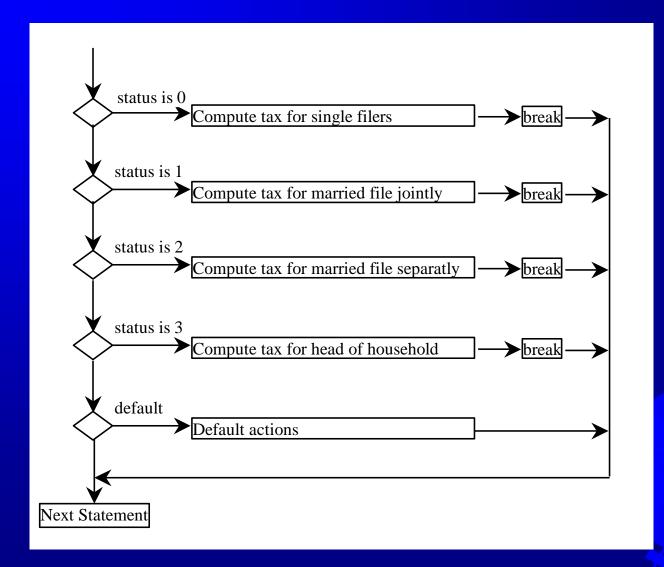

(year % 4 == 0 && year % 100!= 0) || (year % 400 == 0)

#### switch Statements

```
switch (status) {
 case 0: compute taxes for single filers;
       break;
 case 1: compute taxes for married file jointly;
       break;
 case 2: compute taxes for married file separately;
       break;
 case 3: compute taxes for head of household;
       break;
 default: System.out.println("Errors: invalid status");
       System.exit(0);
```

#### switch Statement Flow Chart

#### switch Statement Rules

The <u>switch-expression</u> must yield a value of <u>char</u>, <u>byte</u>, <u>short</u>, or <u>int</u> type and must always be enclosed in parentheses.

The <u>value1</u>, ..., and <u>valueN</u> must have the same data type as the value of the <u>switch-expression</u>. The resulting statements in the <u>case</u> statement are executed when the value in the <u>case</u> statement matches the value of the <u>switch-expression</u>. Note that <u>value1</u>, ..., and <u>valueN</u> are <u>constant</u> expressions, meaning that they <u>cannot contain variables</u> in the expression, such as  $1 + \underline{x}$ .

```
switch (switch-expression) {
 case yalue1: statement(s)1;
      break;
 case value2: statement(s)2;
      break;
 case valueN: statement(s)N;
      break;
 default: statement(s)-for-default;
```

### switch Statement Rules

The keyword <u>break</u> is optional, but it should be used at the end of each case in order to terminate the remainder of the <u>switch</u> statement. If the <u>break</u> statement is not present, the next <u>case</u> statement will be executed.

The <u>default</u> case, which is optional, can be used to perform actions when none of the specified cases matches the <u>switch-expression</u>.

```
switch (switch-expression) {
  case value1: statement(s)1;
    break;
  case value2: statement(s)2;
    break;
...
  case valueN: statement(s)N;
    break;
  default: statement(s)-for-default;
}
```

The <u>case</u> statements are executed in sequential order, but the order of the cases (including the default case) does not matter. However, it is good programming style to follow the logical sequence of the cases and place the default case at the end.

Suppose ch is 'a':

```
switch (ch) {
  case 'a': System.out.println(ch);
  case 'b': System.out.println(ch);
  case 'c': System.out.println(ch);
}
```

ch is 'a':

```
switch (ch) {
  case 'a': System.out.println(ch);
  case 'b': System.out.println(ch);
  case 'c': System.out.println(ch);
}
```

```
switch (ch) {
  case 'a': System.out.println(ch);
  case 'b': System.out.println(ch);
  case 'c': System.out.println(ch);
}
```

```
switch (ch) {
  case 'a': System.out.println(ch);
  case 'b': System.out.println(ch);
  case 'c': System.out.println(ch);
}
```

```
switch (ch) {
  case 'a': System.out.println(ch);
  case 'b': System.out.println(ch);
  case 'c': System.out.println(ch);
}
```

Execute next statement

```
switch (ch)
case 'a' System.out.println(ch);
case 'b' System.out.println(ch);
case '' System.out.println(ch);
}
```

Next statement;

Suppose ch is 'a':

ch is 'a':

Execute next statement

Next statement;

### Conditional Operator

is equivalent to

$$y = (x > 0) ? 1 : -1;$$
  
(boolean-expression) ? expression1 : expression2

Ternary operator Binary operator Unary operator

### Conditional Operator

### Operator Precedence and Associativity

| <b>TABLE 3.10</b> | Operator Precedence Chart                          |
|-------------------|--|
| Precedence        | Operator   |
|                   | var++ and var (Postfix)                            |
|                   | +, - (Unary plus and minus), ++var andvar (Prefix) |
|                   | (type) (Casting)                                   |
|                   | ! (Not)  |
|                   | *, /, % (Multiplication, division, and remainder)  |
|                   | +, - (Binary addition and subtraction)             |
|                   | <, <=, >, >= (Comparison)                          |
|                   | ==, != (Equality)                                  |
|                   | ^ (Exclusive OR)                                   |
|                   | && (AND)   |
|                   | (OR)   |
| <b>\</b>          | =, +=, -=, *=, /=, %= (Assignment operator)        |

### Operator Associativity

All binary operators except assignment operators are *left-associative*.

$$a - b + c - d$$
 is equivalent to  $((a - b) + c) - d$ 

Assignment operators are <u>right-associative</u>.

$$a = b += c = 5$$
 is equivalent to  $a = (b += (c = 5))$ 

### Example

Applying the operator precedence and associativity rule, the expression 3 + 4 \* 4 > 5 \* (4 + 3) - 1 is evaluated as follows:

$$3 + 4 * 4 > 5 * (4 + 3) - 1$$
 $3 + 4 * 4 > 5 * 7 - 1$ 
 $3 + 16 > 5 * 7 - 1$ 
 $3 + 16 > 35 - 1$ 
 $19 > 35 - 1$ 
 $19 > 34$ 
false

- (1) inside parentheses first
- (2) multiplication
- (3) multiplication
- (4) addition
- (5) subtraction
- (6) greater than

#### (GUI) Confirmation Dialogs

int option = JOptionPane.showConfirmDialog
 (null, "Continue");

#### Return value:

JOPTION (0) for the Yes button, JOPTION (1) for the No button, and JOPTION (1) for the No button, and JOPTION (2) for the Cancel button.

### Example

# input using 5 Confirm dialogbox output using 1 Message dialogbox
